trifectiv® plus WOUND & BURN CARE

CHRONIC WOUNDS

INFECTED ULCER
ON ANTERO-LATERAL ASPECT RIGHT FOOT

Context: A chronic infected foot ulcer of unknown origin. The photographs show infected crust, biofilmed and with severe inflammation.

Treatment Plan: The ulcer was sprayed with Trifectiv® Plus. Multiple sheets of Trifectiv-wetted gauze were applied, held with a crepe bandage, and changed daily. A compression device was used as the circulation allowed.

Results: The frames show the acute infected phase (day 0), the biofilm (day 3) and well-established healing (day 10).

Tip: Why gauze? Woven gauze lifts exudate, necrotic tissue and biofilm as it comes off. Use at least five sheets and wet every layer with Trifectiv® Plus. Offload the foot and apply an elastic stocking or the ulcer will not close.
