trifectiv® plus WOUND & BURN CARE

PRESSURE SORES

CHRONIC PRESSURE SORE **OF THE HIP**

Context: The patient presented with a chronic pressure sore over the hip.

Treatment Plan: Necrotic tissue was debrided. The cavity was then packed with Trifectiv-wetted gauze so that every surface was in contact with the solution, and the dressing was changed daily.

Results: The sore had healed within six weeks.

Tip: To relieve pressure and help prevent pressure sores, change position regularly and keep moving or stand whenever possible. If you cannot move independently, ask a carer to reposition you and use pressure-relieving mattresses or cushions to protect vulnerable areas.
