trifectiv plus WOUND & BURN CARE

BURNS

DEEP PARTIAL-THICKNESS
SCALD ON CHEST

Context: A 2-year-old boy presented with a deep partial-thickness scald to the chest. Twelve hours after the burn the wound was shiny and inflamed, consistent with early biofilm.

Treatment Plan: The burn was sprayed with Trifectiv® Plus. A single layer of paraffin gauze was laid on the burn, then Trifectiv-wetted gauze over that, retained with a crepe bandage. The dressing was changed daily.

Results: Inflammation settled rapidly. Once healed, no scarring was seen.

Tip: Trifectiv® Plus keeps infection and inflammation under control, which is why scarring is usually minimal.
