trifectiv® plus WOUND & BURN CARE

SURGICAL WOUNDS

DEHISCED ABDOMINAL WOUND **AFTER BOWL-PERFORATION REPAIR**

Context: A man in his late forties developed a surgical-site infection after repair of a bowel perforation. Standard care failed. On day 1 of Trifectiv® Plus the wound measured 8.5 × 4.5 × 5 cm and was infected, biofilmed and inflamed.

Treatment Plan: The cavity was sprayed, then packed with several layers of Trifectiv-wetted gauze so the pack filled the defect. A breathable dressing held it. The pack was changed daily.

Results: Infection, biofilm and inflammation settled within days. The wound had closed within a month.

Tip: Pack a deep cavity. Surface spraying alone will not reach the base. Premium-grade hypochlorous acid remains active against MRSA, Pseudomonas, Candida and CRE, whether antibiotic-sensitive or drug-resistant.
