trifectiv® plus WOUND & BURN CARE

CHRONIC WOUNDS

DIABETIC FOOT ULCER

Context: A diabetic patient presented with a foot ulcer that had not healed for two years, despite several treatments including surgical debridement. The wound was inflamed, necrotic and infected.

Treatment Plan: The ulcer was sprayed with Trifectiv® Plus and allowed to dry. Gauze wetted with Trifectiv® Plus was applied and held with a crepe bandage or breathable plaster. Occlusive dressings were avoided. The dressing was changed daily.

Results: The ulcer had closed by 14 weeks.

Tip: For wounds on the lower legs, patients should always apply a compression stocking from the foot to the knee over the bandage to control inflammation. This should be worn 24/7 unless circulation forbids it.
