trifectiv® plus
WOUND & BURN CARE

SURGICAL WOUNDS

INFECTED
CAESAREAN SECTION WOUND

Context: A 30-year-old woman developed a surgical-site infection after caesarean section and was re-admitted on day 8. Three weeks of standard care did not improve the wound. She was discharged to a clinic. On the first day of Trifectiv® Plus the wound was infected, biofilmed and inflamed.

Treatment Plan: The wound was sprayed with Trifectiv® Plus. Five layers of Trifectiv-wetted gauze were placed into the wound and held with a breathable adhesive dressing. The pack was changed daily.

Results: Infection, biofilm and inflammation had cleared within a week. The wound had closed by seven weeks.
