SURGICAL WOUNDS

INFECTED WOUND
AFTER ANKLE-PLATE REMOVAL

Context: A 28-year-old man had an ankle plate removed after fracture fixation. The wound stayed open despite repeated antibiotics and local antiseptics.

Treatment Plan: Trifectiv-wetted gauze was packed into the wound daily and held with an elastic stocking to control swelling.

Results: The wound had closed after 28 days.

Tip: Pack the gauze so it touches every part of the cavity. That is what allows wet-to-moist debridement.
