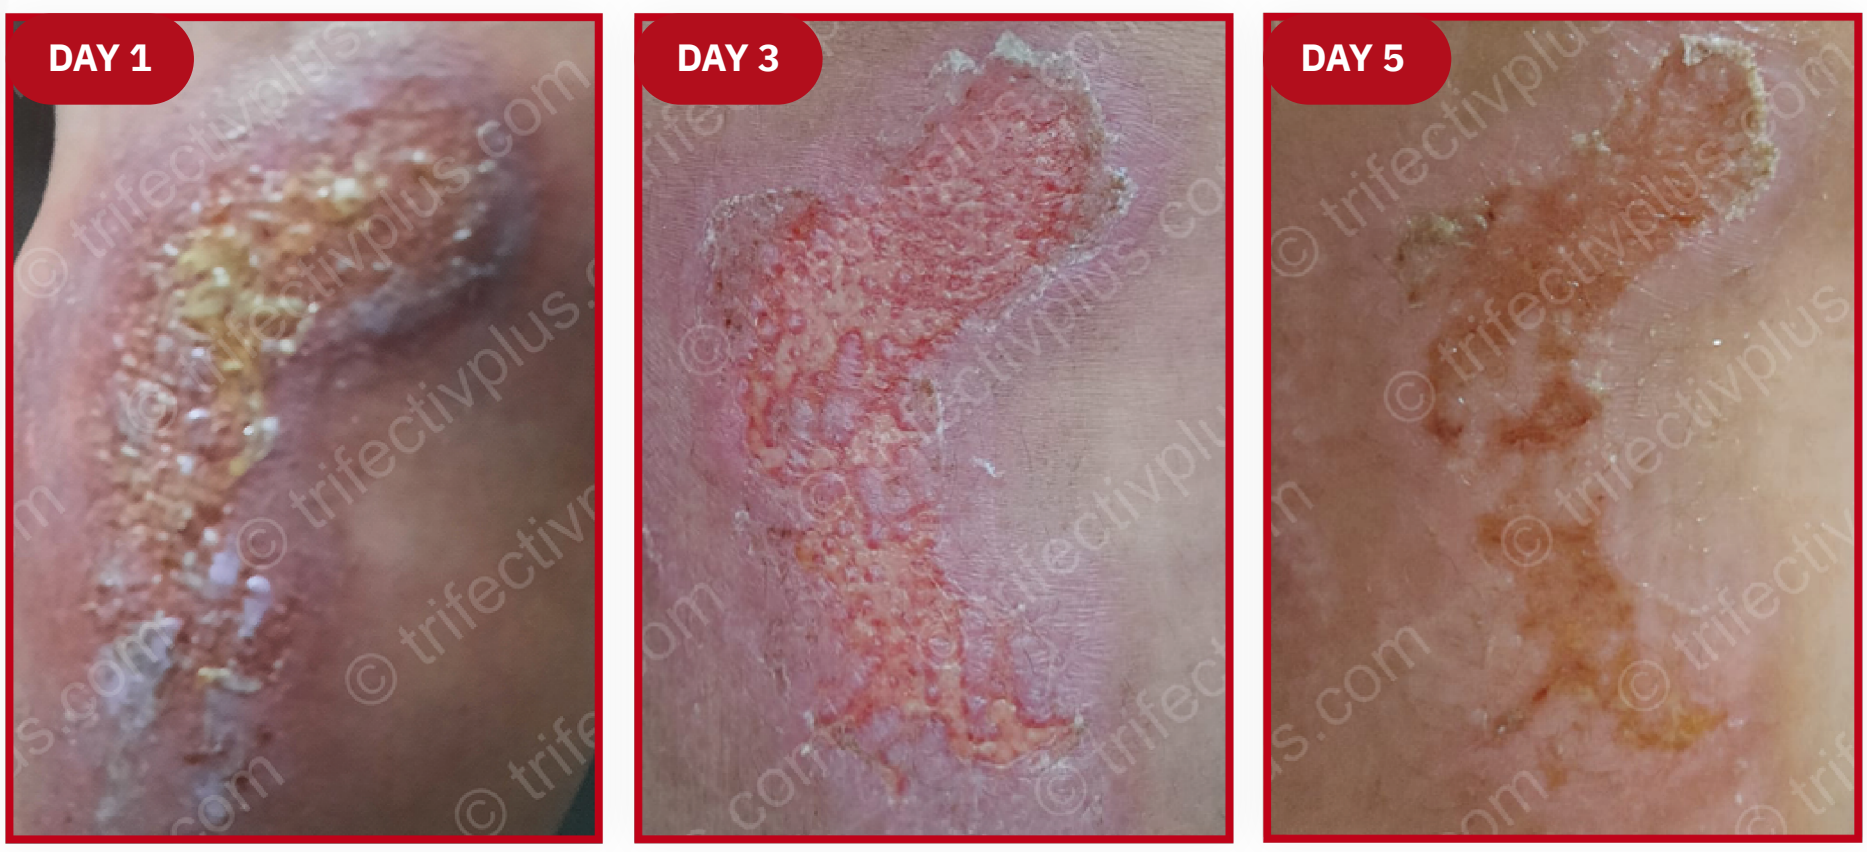
trifectiv® plus WOUND & BURN CARE

SKIN INFECTIONS & IRRITATIONS

SKIN INFECTION
STAPHYLOCOCCUS AUREUS

Context: The patient fell on rocks and developed a Staphylococcus aureus wound infection with surrounding cellulitis.



Treatment Plan: The wound was sprayed with Trifectiv® Plus. Paraffin gauze was applied, then three to five sheets of Trifectiv-wetted gauze, held with a crepe bandage and changed daily. Oral antibiotics were given for the cellulitis.

Results: The infection had cleared, and the wound had healed after five days.

Tip: The solution works fastest when the wetted gauze is in direct contact with the wound. That is also how wet-to-moist debridement happens.
