trifectiv® plus WOUND & BURN CARE

ACUTE WOUNDS

TRAUMATIC SKIN FLAP
AFTER A FALL FROM A LADDER

Context: An elderly woman slipped from a ladder and sustained a traumatic skin flap on the lower leg.

Treatment Plan: The wound was sprayed with Trifectiv® Plus, including the undersurface of the loose flap. A single layer of non-medicated paraffin gauze was applied, followed by three to five sheets of Trifectiv-wetted gauze, and secured with a crepe bandage. The dressing was changed daily.

Results: The flap was preserved, and the wound was fully healed within 26 days.

Tip: Trifectiv® Plus is suitable for skin trauma at any age. Older skin is thinner and tears more easily. A flap can often be saved if it is still viable, treatment is started early, and the patient's general health allows. Black skin is necrotic and should be removed. After spraying, apply paraffin gauze, then three to five layers of Trifectiv-wetted gauze, held with a crepe bandage.
